

Information interoperability is the ability to use and transfer information in a consistent and efficient manner across multiple organizations and IT systems to accomplish operational missions.

Project Interoperability is an information interoperability start-up guide that makes tools and resources available to government and the private sector for improving information interoperability.

Interoperability allows organizations to:

- share information
- leverage resources
- reduce duplicative systems
- cut excessive costs

Achievable only when we all "speak the same language," the goal of Project Interoperability is to assist the government and the private sector to establish a baseline of terms, tools and techniques as a foundation for greater information sharing.
